Install long Motor Housing Screw [12] (108mm) through screw opening in Motor Housing [55], located beneath the C-Channel Depth Bracket stud [76].

Place a drop of white glue onto each Rubber Plug [102] prior to reinstalling into pockets of Motor Sleeve [60].

When installing Field [42] into the Motor Sleeve [60], make sure the white field lead is in the wire trap before securing Field Screws [20].

Lubricate inside lip and outside diameter of Oil Seals [104,105] prior to installing into Gear Case [54].

Rubber Slug [118] is located in the bottom area of the handle halves. Place a drop of glue or RTV to secure in place.

The Depth Adjustment Lever [77] should be above the plane of the shoe and .50" minimum from the tip of the lever to the right handle half vent when tightened.

NOTE: For item #22, some earlier tools may have used 05-74-0970 (M5 x 10 Flat Hd. T-20 screw). A drop of "Blue" Loctite, Type 242 is needed on the threads.

MAINTAINING OIL LEVEL

Check oil level before use. To check level, set saw for maximum depth, rest it flat on its shoe and check oil level window. Oil level should be below max oil level line on tool (about 1/2 oz.).

If oil level is low:

1. Add oil by setting the saw on its shoe and remove the oil plug.
2. Pour oil into chamber. DO NOT OVER FILL.
3. When the proper oil level is reached, replace the oil plug.

Functionally check the spindle lock mechanism. Spindle lock must return briskly when released from engagement in gear.

Shoulder side of Locking Cog [99] to face Worm Gear [61].

Recessed (cut groove) on Worm Gear [61] to face threaded end of Spindle [68].

Concave side of Blade Spring Washer [91] to face Outer Flange [88].

Blade Screw [33] has a left hand thread.

Functionally check the Lower Guard [53] with the saw set at full depth of cut. Place the saw upside down with the shoe horizontal. Fully retract the guard using guard lever and than release it. The guard must close briskly. Repeat the guard check two more times.
